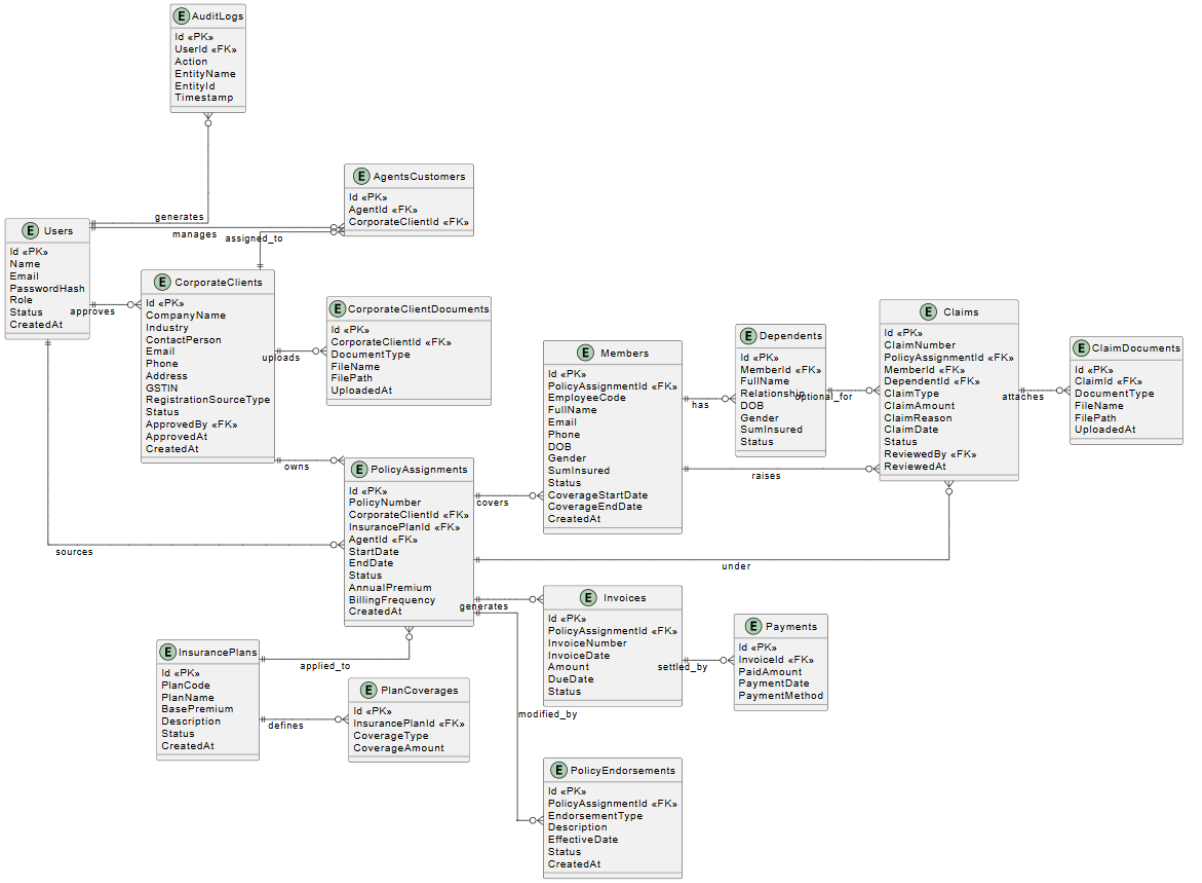
Entity-Relationship Diagram



The Entity Relationship Diagram illustrates the structural design of the Employee Group Insurance System, defining how users, corporate clients, insurance plans, policy assignments, members, claims, billing, and endorsements are interconnected. It ensures data integrity, supports operational workflows, and provides a clear blueprint for scalable, consistent, and efficient system implementation.

Additionally, the diagram clarifies primary and foreign key relationships, ensuring referential integrity and minimizing data redundancy. It provides a logical foundation for implementing constraints, validations, and efficient queries. By visualizing dependencies among core entities, the ER diagram supports maintainability, consistency, and accurate mapping between the database schema and application layers.
